November 2015

WRITTEN EXAMINATION
SHORT ANSWER QUESTIONS

EXAMINATION TIME: 120 minutes

DIRECTIONS TO CANDIDATES

1. Answer each question in the space provided in this booklet.
2. All questions should be attempted
3. All SAQ’s are of equal weighting
5. Do not begin the exam until instructed to do so.
6. Write your candidate number on every page — the booklet will be separated for marking purposes.
7. DO NOT write your name on the examination booklet.
QUESTION 1

A 45-year-old man presents to the emergency department with a history of sudden collapse on a golf course. He was initially unconscious but is now talking and asking what happened.

His vital signs are:
BP  95/60 mmHg
HR  126 / min
RR  15 / min

Picture of the 45-year-old man:
Describe the appearance of the patient’s exposed torso and list 6 signs and symptoms that can be associated with this presentation.

i) The appearance (1 mark):

________________________________________________________________________

ii) The associated signs and symptoms (6 marks):

1. _______________________________________________________________________

2. _______________________________________________________________________

3. _______________________________________________________________________

4. _______________________________________________________________________

5. _______________________________________________________________________

6. _______________________________________________________________________

iii) List 3 complications of this injury (3 marks)

1. _______________________________________________________________________

2. _______________________________________________________________________

3. _______________________________________________________________________
QUESTION 2

A 30-year-old man is brought to your emergency department after a wrestling match with a friend. He has pain in his shoulder and feels he is unable to move it.

You find the patient in the bed with the appearance shown below and x-rays are taken.
i) Briefly describe the x-ray shown above in the context of the patient’s presentation (2 marks)

_________________________________________________________________

_________________________________________________________________

ii) Describe two potential complications of this presentation (2 marks)

a)_________________________________________________________________

b)_________________________________________________________________

iii) List 3 drug choices that could be used for procedural sedation in this patient and list 1 potential pros and cons for each (6 marks)

<table>
<thead>
<tr>
<th>Drug Choice and Dose</th>
<th>Pro</th>
<th>Con</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>

</tbody>
</table>
QUESTION 3

A 40-year-old man presents to the Emergency Department (ED) after a Motor Vehicle Accident. He is the front seat passenger and the driver, his wife, has died at the scene.

His initial observations are:

<table>
<thead>
<tr>
<th>Observations</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blood Pressure</td>
<td>120/60 mmHg</td>
</tr>
<tr>
<td>Respiratory Rate</td>
<td>20 / min</td>
</tr>
<tr>
<td>Heart Rate</td>
<td>90 / min</td>
</tr>
<tr>
<td>Temperature</td>
<td>37.0 degrees</td>
</tr>
<tr>
<td>Oxygen Saturations</td>
<td>100% (on 6 litres by Hudson Mask)</td>
</tr>
</tbody>
</table>
i) Briefly describe 4 main abnormalities in the appearance of the patient in the above picture.
(2 marks)

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

ii) List and justify 4 investigations of choice to identify common injuries associated with this presentation. (4 marks)

<table>
<thead>
<tr>
<th>Investigation</th>
<th>Injuries Sought / Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td></td>
</tr>
</tbody>
</table>
iii) The police arrive and confirm the patient’s wife has died.

Briefly outline your approach to dealing with this situation in view of the patient asking the Trauma team “how is my wife?”

(4 marks)
QUESTION 4

A 17-year-old man presents your Emergency Department by ambulance with shortness of breath and nausea following a “rave” at a locally infamous disused warehouse.

His friends called the ambulance because of a sudden collapse. His background history is unknown.

Initial Observations:

Blood Pressure 110/70 mmHg
Respiratory Rate 32 / min
Heart Rate 120 / min (regular)
Temperature 38.5 degrees
Oxygen Saturations 84% (on 10 litres via Hudson mask)

In view of the patient’s presentation you elect to take an arterial blood gas, which is shown below:

PH 7.25
pCO2 33
pO2 580
HCO3 14
Lactate 13
Colour: chocolate brown

i) Briefly describe the abnormalities on this patient's blood gas (4 marks)

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

____________________________  _______________________________________________
ii) State the likely unifying diagnosis in this case and 2 potential causes (3 marks)

<table>
<thead>
<tr>

iii) Outline the key steps in the management of this patient (4 marks)

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
QUESTION 5

A four (4)-year-old boy presents with his father to the Emergency Department.

He has a fever of 39.0 degrees and a sore mouth. He is miserable and shy at triage

i) What features in your clinical assessment in the Emergency Department would suggest a diagnosis of Kawasaki Disease? (5 marks)

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
ii) In children with confirmed Kawasaki’s disease what is the approximate prevalence of Coronary Artery Aneurysm? (1 mark)

iii) What key steps do you take to:

a. Calculate the child’s weight (1 mark)

b. Decide on a disposition for the child (3 marks)
QUESTION 6

It is late evening on a weeknight.

You are the senior doctor in a tertiary level Emergency Department.

The 20 bedded ED currently has all but two cubicles occupied.

Ambulance control rings to notify you that an ambulance is en route (ETA 5 mins) with a 59-year-old man with a probable acute myocardial infarct.

All 5 of your resuscitation bays are occupied by the following:

1) A 75-year-old lady with unstable angina. She is awaiting a bed in the cardiology unit.
2) A 50-year-old man with resolved chest pain and normal ECG. He has just arrived by ambulance and is yet to be assessed.
3) A 3-year-old girl with croup. She is now stable 30 minutes after nebulised adrenaline.
4) A 22-year-old man being monitored 2 hours following an overdose of the drug Carbamazepine.
5) A 17-year-old man with a closed head injury. He is about to be intubated by your registrar because his GCS has fallen to 9/15.

i) How will you prepare the ED to accommodate the new ambulance patient? (3 marks)

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
ii) The patient arrives please comment on his ECG (3 marks)
iii) The patient has a short run of non-sustained VT. Describe 4 possible anti-arrhythmic agents that could be used specifying drug, dose as well as 1 pro and 1 con of each (4 marks)

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dose</th>
<th>Pro</th>
<th>Con</th>
</tr>
</thead>

</tbody>
</table>
QUESTION 7

A 65 year old male, known diabetic on oral hypoglycaemics, presents having been unwell for about one week. He is brought in by family as they have been having trouble waking him up.

His observations upon arrival are as follows:

- GCS 12
- Temperature 38 degrees Celsius
- HR 95 / minute
- BP 100/60 mmHg
- BSL “Hi”
- Ketones 0.3 on finger prick.

**ABG result:**

<table>
<thead>
<tr>
<th>Parameter</th>

You suspect this patient has Hyperglycaemia Hyperosmolar Non Ketotic Syndrome.
i) List six (6) differential diagnoses that may have precipitated the event (3 marks)

1. ________________________________________________________________
2. ________________________________________________________________
3. ________________________________________________________________
4. ________________________________________________________________
5. ________________________________________________________________
6. ________________________________________________________________

ii) What is the estimated plasma osmolality (include your equation)? (1 mark)

________________________________________________________________________

iii) What is the estimated water deficit (include your equation)? (1 mark)

________________________________________________________________________
iv) Outline your fluid and electrolyte management of this patient (5 marks)

1.______________________________________________________________________________

2.______________________________________________________________________________

3.______________________________________________________________________________

4.______________________________________________________________________________

5.______________________________________________________________________________
A 23 year old who is 28/40 pregnant has arrived by ambulance post alleged assault. She has obvious head injuries and is complaining of abdominal pain.

Her vital signs are:

GCS 10
HR 160 / min
BP 90 mmHg
RR 40 / min

i) List 2 potential obstetric causes of the abdominal pain for this patient (1 mark)

1. __________________________________________
2. __________________________________________

ii) What are the airway considerations in this patient (4 marks)

1. __________________________________________
2. __________________________________________
3. __________________________________________
4. __________________________________________
iii) Describe your preparation for rapid sequence intubation of this patient (5 marks)

1. _____________________________________________________________________________

2. _____________________________________________________________________________

3. _____________________________________________________________________________

4. _____________________________________________________________________________

5. _____________________________________________________________________________
An 85 year old female from a nursing home presents with abdominal pain and confusion. She has history of atrial fibrillation on warfarin and type 2 Diabetes on oral hypoglycaemics.

**Her findings on examination are:**
Pale, diaphoretic and in obvious distress

Temperature 37.8 degrees Celsius  
HR 90 / min  
BP 90/50 mmHg  

Abdominal examination reveals diffuse tenderness.

i) List the steps you would take to manage her confusion? (4 marks)

1. 

2. 

3. 

4. 

ii) List 4 differential diagnoses of her abdominal pain? (2 marks)

1. 

2. 

3. 

4. 

iii) List 3 Pros and 3 Cons for the use of abdominal-pelvic CT in this patient (3 marks)

<table>
<thead>
<tr>
<th>Pros</th>
<th>Cons</th>

</table>

iv) In the event of life threatening haemorrhage, what agents and dose would you use to reverse warfarin effect? (1 mark)

1. ________________________________________________________________

2. ________________________________________________________________
QUESTION 10

One of the nurses approaches you with a drug chart requesting analgesia for a 45 year old male who is a known alcoholic. She tells you that he is sweaty, agitated and complaining of severe epigastric pain. She is having difficulty obtaining observations on him because he will not sit still

i) What are your first steps in response to the nurse’s request (1 mark)

1. 

2. 

ii) List 6 differential diagnoses for his epigastric pain? (3 marks)

<p>| | |</p>
<table>
<thead>
<tr>

</tbody>
</table>

iii) What other acute issues need to be considered in management of this patient? (2 marks)

1. 

2. 
The patient becomes drowsy after 2.5 mg of morphine. He appears pale.

Observations are noted:
Temperature 36.5 degrees Celsius
HR 110 / min
BP 80/50 mmHg

iv) What are the ED management of suspected acute upper GI bleed in this patient? (4 marks)

1. __________________________________________________________________________

2. __________________________________________________________________________

3. __________________________________________________________________________

4. __________________________________________________________________________
QUESTION 11

An 80 year old male presents to your ED with lethargy and progressive functional decline over the last week.

He has a background of Ischaemic heart disease and is on Aspirin, Digoxin and Pantoprazole.

Physical examination reveals signs of biventricular failure

Vital signs are as follows:

BP 105/60 mmHg
RR 25 / min
O2 saturation 97% room air
Afebrile

A 12 lead ECG is performed while the patient is in the resuscitation room

(See attached)

(i) Describe the two (2) most important abnormalities on this ECG (2 marks)
(ii) List the two (2) important investigations you would perform in the ED to assist you and justify your selection (4 marks)

<table>
<thead>
<tr>
<th>Investigation (2 marks)</th>
<th>Justification (2 marks)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td></td>
</tr>
</tbody>
</table>

(iii) List your preferred three (3) options to manage his heart rhythm in the ED (in order of use, with doses where required) and 2 contraindications for each

<table>
<thead>
<tr>
<th>Treatment option including doses (3 marks)</th>
<th>Contraindication (6 marks)</th>
</tr>
</thead>
<tbody>
<tr>

QUESTION 12

A previously well 66 year old male is brought to your rural Emergency Department following a fall. He has a history of lung cancer which was successfully managed 10 years ago and has been in remission since. He is on no medications. He has an abrasion to his forehead, for which he has associated pain, but has no other injuries.

His vital signs upon arrival are as follows:

Confused

HR 75 / minute

BP 145 / 75 mmHg

Afebrile

BSL 7.5 mmol / L

A CT is ordered (see image)
(i) Describe 3 important findings on this CT (3 marks)

____________________________________________________________________________

____________________________________________________________________________

____________________________________________________________________________

(ii) In order of likelihood (most to least likely), list 4 locations where this lesion could have emerged from (2 marks)

____________________________________________________________________________

____________________________________________________________________________

____________________________________________________________________________

____________________________________________________________________________

(iii) List 2 important medications you would administer in the 1st hour and the dose (4 marks)

<table>
<thead>
<tr>
<th>Medication (2 marks)</th>
<th>Dose (2 marks)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</table>
The patient has a grand mal seizure requiring benzodiazepines and phenytoin loading. He is noted to have a reduced GCS and a unilateral dilated pupil. You have successfully intubated him. His current HR is 45/min and BP 195/65 mmHg
iv) Describe your next 5 steps in his immediate management (5 marks)
QUESTION 13 / 14 (double question)

A 62 year old known brittle asthmatic arrests at home following a viral illness and shortness of breath for the last 6 hours not responding to her usual bronchodilators.

She is rapidly attended to by the local ambulance service who intubate her on scene and bring her to your Emergency Department.

There is no other available history.

Her initial ABG is as follows:

- pH: 6.7
- PCO2: 205 mmHg
- pO2: 110 mmHg
- Fi02: 100%
- Bicarbonate: 21 mmol/L
- Lactate: 9.7 mmol/L
- EUC’s: normal

(i) Describe the three (3) main abnormalities on the gas (3 marks)
Her current vital signs show HR 140 regular, BP 145 / 80 mmHg, saturations 98%

(ii) Outline your initial ventilator settings in the table below (5 marks)

<table>
<thead>
<tr>
<th>Ventilator settings (1 mark each)</th>
</tr>
</thead>
<tbody>
<tr>
<td>FiO2</td>
</tr>
<tr>
<td>I/E ratio</td>
</tr>
<tr>
<td>PEEP</td>
</tr>
<tr>
<td>Tidal volume</td>
</tr>
<tr>
<td>Respiratory rate</td>
</tr>
</tbody>
</table>

Ten minutes after arrival, she starts ‘bucking’ on the tube and becomes agitated.

Her blood gas result remains unchanged

(iii) Describe 5 important medications (with doses) that you would administer at this time (5 marks)

<table>
<thead>
<tr>
<th>Medication</th>
<th>Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

After 1 hour she remains intubated, her blood pressure drops to 60/40mmHg and she becomes difficult to ventilate
(iv) Describe your stepwise approach to this problem (5 steps, 5 marks)
A 10 year old boy presents with a 1 week of lethargy and urinary frequency and a day of severe vomiting. 
He is drowsy and breathless. Mucosal membranes are very dry. 
He has no other known medical problems

Vital signs upon arrival are as follows:
- HR: 140 / minute
- BP: 90/40 mmHg
- RR: 30 / minute
- SpO2: 100%
- Afebrile

VBG shows:
- pH: 7.05
- PCO₂: 28 mmHg
- PO₂: 40 mmHg
- HCO₃: 6 mmol/L
- BE: -18
- K: 4.5 mmol/L (3.5 – 5.2)
- Na: 120 mmol/L (135 – 145)
- Cl: 90 mmol/L (96 – 106)
- Glucose: 45 mmol/L (3.5 – 5.0)
- Lactate: 2.3

(i) List two (2) formulae that will aid your analysis of these blood results, and use them to calculate three (2) values. (4 marks)

</tbody>
</table>

(v) The mother decides she is taking the daughter home without treatment. List 3 strategies to deal with this. (3 marks)

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________
A 69-year-old lady presents to the Emergency Department (ED) with a history of sudden collapse.

She is brought in by ambulance and has a GCS of 7 on arrival in the ED.

Her observations upon arrival are as follows:

BP 66 / 40mmHg
HR 40 / min
RR 8 / min
Oxygen Saturations 89% (on 15 litres by Hudson Mask)

An ECG is performed (see next page)

a) List the main abnormalities on this patient’s Electrocardiogram (3 marks)
b) List four (4) differential diagnosis for this ECG (2 marks)

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
Question 20

A 46 year old man presents with fever, headache, and meningism. He has a history of chronic alcoholism. There are no allergies. He is on no medications. His vital signs upon arrival are as follows:

- alert and orientated
- temperature 38.1 degrees Celsius
- HR 95 / min
- BP 105/60 mmHg
- BSL 9.4 mmol/L

a) List 6 indications for performing a CT brain before lumbar puncture in this man (6 marks)

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

b) Following a normal CT head, you proceed with an uncomplicated lumbar puncture. These are the results:

- Clear colour
- Opening pressure 25 cm H20
- Protein 0.6 g/L (0.18 - 0.45)
- CSF Glucose 4.2 (2.5 - 3.5)
- White cells 965 x 10^6 / L (50% polymorphs)
- Red cells 350 x 10^6 / L

Describe 3 main abnormalities and what is your working diagnosis (4 marks)

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
c) List 3 medications you would give empirically for this patient. Give doses and frequency. (3 marks)

<table>
<thead>
<tr>
<th>Medication</th>
<th>Dose</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
